Project 1: Tata Motors Ltd. — DCF Valuation

Objective: Estimate Tata Motors' intrinsic equity value per share using a five-year FCFF DCF, benchmarked against the prevailing market price.

Methodology

- Built WACC bottom-up using a five-company Indian auto peer set (M&M, Maruti Suzuki, Tata Motors, Hyundai Motor India, Force Motors); unlevered and relevered beta to a target capital structure.
- Derived ROIC and reinvestment rate from five years (FY21–FY25) of invested capital, EBIT, and net working capital data to estimate an intrinsic growth rate, rather than assuming a flat growth input.
- Forecast five years of explicit FCFF using a declining reinvestment-rate glide path, applied mid-year discounting convention, and a Gordon Growth terminal value.

Key Outputs

- WACC: 15.29% (Cost of Equity 16.78%; Post-tax Cost of Debt 1.13%; target D/E 10.53%).
- Historical ROIC ranged from 23.6% (FY21) to 96.0% (FY25), reflecting sharply improving capital efficiency post-COVID.
- Built a five-year explicit FCFF forecast with a 6.5% Gordon Growth terminal value to derive intrinsic equity value. Implied Equity Value Per Share: ₹786.49, presented as a standalone valuation as of FY25 (prior to Tata Motors' October 2025 demerger into separately listed commercial vehicle and passenger vehicle/JLR entities).

Skills Demonstrated

- WACC construction & beta unlevering/relevering, ROIC-driven growth modeling, FCFF forecasting, terminal value, and DCF sensitivity to market price.

Project 2: HDFC Bank – HDFC Ltd. Merger — Accretion/Dilution Model

Objective: Model the all-stock merger of HDFC Bank (acquirer) and HDFC Ltd. (target) and assess the resulting EPS impact on the combined entity.

Methodology

- Structured the deal as 100% stock consideration at a 4% target premium to HDFC Ltd.'s share price, with no cash or debt funding.
- Combined acquirer and target net income, layered in after-tax pre-tax synergies of \$488mn, and recalculated proforma shares outstanding post-issuance.
- Computed standalone vs. proforma EPS to quantify accretion/dilution.

Key Outputs

- Total equity purchase price: ~\$62.3bn (3,096mn new shares issued).
- Proforma EPS of \$0.69 vs. acquirer standalone EPS of \$0.71 — a -2.84% dilution, consistent with an all-stock deal where the target's earnings yield is lower than the acquirer's cost of equity.

Skills Demonstrated

- Purchase price & exchange ratio mechanics, stock consideration structuring, synergy treatment, and proforma EPS / accretion-dilution analysis.

Certifications & Training

Citi Investment Banking Job Simulation — Forage, 2026: Built a five-year revenue and margin-driven income statement forecast; applied trading comparables methodology (EV/Revenue, EV/EBITDA) across big-box retail peers to derive implied valuation ranges.

Note: Both models were built independently as part of self-directed financial modeling practice, applied to real, publicly listed companies using reported financial statements.
